Delegates found by the proposer agents, 27 October 2026

Instance. Planner input $u = (s, h, g)$ with square fence $[-s, s]^2$, home h, goal g. Mission $w = (w_1, w_2)$. Environment $e = (p_0, dt)$ with start p_0 and tick lengths dt_t. Controller targets y_t for $t = 0, \dots, 8$. Top-level contract $A = \{25 \le s \le 50,\ \|h\|_\infty \le s - 3,\ \|g\|_\infty \le s + \frac{1}{2},\ \|p_0 - h\|_\infty \le 1,\ \forall t\ dt_t \in [0.9, 1.1]\}$ and $G = \{\forall t\ y_t \in [-s, s]^2\} \cap \{\exists t\ \|y_t - g\| \le 3\}$. Conditions checked: D1 $A \subseteq A_1$, D2 $G_1 \subseteq A_2$, D3 $A \cap G_1 \cap A_2 \cap G_2 \subseteq G$, R $\forall u \in A_1\ \exists w\ G_1(u, w)$, then C1 planner R4 $\models (A_1, G_1)$ and C2 controller $\models (A_2, G_2)$. Every pair below passed all six.

Shared by all three. $A_1 = \{25 \le s \le 50,\ \|h\|_\infty \le s - 3,\ \|g\|_\infty \le s + \frac{1}{2}\}$, the part of A about u. $A_2 = V = \{5 \le \|w_2 - w_1\|_\infty \le 100,\ \|w_1\|_\infty \le 100,\ \|w_2\|_\infty \le 100\}$, the controller's input guards. $P = \{5 \le \|w_1 - p_0\|_\infty \le 100,\ \|p_0\|_\infty \le 100,\ \forall t\ dt_t \in [\frac{1}{2}, \frac{3}{2}]\}$, the controller's clamps. Each G_2 has the form $\neg P \cup (\text{tube} \cap \text{reach})$ and each G_1 has the form $V \cap (\neg A_1 \cup M)$ with M the mission margins listed.

Proposer A (tightest from code; 2 rounds, 6 min).

$$\text{tube}_A:\ \forall t\, \forall k \in \{x, y\} \quad \min(p_{0,k}, w_{1,k}, w_{2,k} - 1) \le y_{t,k} \le \max(p_{0,k}, w_{1,k}, w_{2,k} + 1), \qquad \text{reach}_A:\ \exists t\ y_t = w_2.$$

$$M_A:\ 6 \le \|w_1 - h\|_\infty \le 99, \quad \|h\|_\infty \le s - 1, \quad \|w_1\|_\infty \le s, \quad \|w_2\|_\infty \le s - 1, \quad \|w_2 - g\|^2 \le 9.$$

Offset 0.99 in place of 1 fails C2 with a blend-tick target 0.9967 m past w_2, so the offset is tight.

Proposer B (coarse then tighten; 3 rounds, 9 min), with $\rho = \frac{5}{4}$.

$$\text{tube}_B:\ \forall t\ \ y_t \in \text{bbox}(p_0, w_1, w_2) \oplus [-1, 1]^2, \qquad \text{reach}_B:\ \exists t\ \|y_t - w_2\| \le \tfrac{1}{2}.$$

$$M_B:\ 6 \le \|w_1 - h\|_\infty \le 99, \quad \|h\|_\infty \le s - \rho - 1, \quad \|w_1\|_\infty \le s - \rho, \quad \|w_2\|_\infty \le s - \rho, \quad \|w_2 - g\| \le \tfrac{5}{2}.$$

Phase 1 passes for $\rho \in [1, 1.2675]$. Below 1 the grown box leaves the fence (D3 fails at $s = 26$, $h = (-22, -22)$, $g = (0, 0)$); above 1.2678 a goal near a corner has no mission (R fails at $s = 25$, $g = (-25.50, 25.5)$).

Proposer C (corner-shaped; 1 round, 4 min).

$$\text{tube}_C:\ \forall t\ \ y_t \in \text{box}(p_0, w_1)\ \cup\ \text{box}(w_1, w_2)^+, \qquad \text{reach}_C:\ \exists t\ y_t = w_2,$$

where $\text{box}(w_1, w_2)^+$ is $\text{box}(w_1, w_2)$ grown, on each axis k and only on the side facing p_0, by $\min(1, \max(0, p_{0,k} - w_{1,k})/2)$.

$$M_C:\ 6 \le \|w_1 - h\|_\infty \le 99, \quad \|w_1\|_\infty \le s, \quad \|w_2\|_\infty \le s - 1, \quad \|w_2 - g\|^2 \le 9.$$

Against the algorithmic delegates (uniform tube of radius 1 around both legs, reach within $\frac{1}{2}$, margins $\|w_1\|_\infty \le s - 1$, $\|w_2\|_\infty \le s - 1$, $\|h\|_\infty \le s - 2$ and $\|w_2 - g\| \le \frac{5}{2}$): A and C drop the margin on w_1 and widen the goal tolerance to 3, because the handover code moves the target back along leg 1 by less than 1 m and lands exactly on w_2; B is coarser on the controller side and faster to discharge.

check	D1	D2	D3	R	C1 (R4)	C2
A	0.03 s	1.4 s	5.7 s	0.3 s	0.6 s	38.7 s
B	0.04 s	1.8 s	6.6 s	0.5 s	0.7 s	18.9 s
C	0.03 s	1.3 s	7.6 s	0.5 s	0.5 s	41.4 s
