1 Text

Filler text so the figure has somewhere to float. Figure 1 shows the framework.

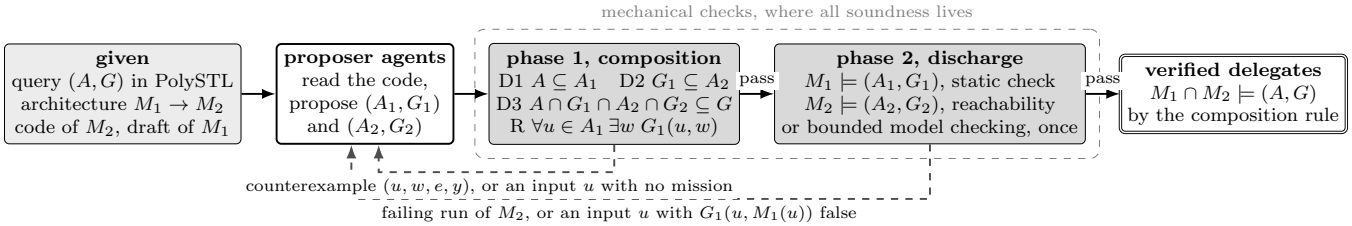

Figure 1: Agentic delegation. Proposer agents read the query, the architecture and the source code and propose candidate delegates; phase 1 checks the composition conditions and realizability on formulas alone; phase 2 discharges each component against its delegate, the planner by a static check and the controller once by reachability or bounded model checking; every failure returns a counterexample to the proposers, and a pair that passes both phases is sound regardless of how it was proposed.
